

## Example calculation for a mortgage

Typically, a household can obtain a mortgage of 3.5 times their annual income, and would expect to need a deposit of approx 10% of the total price.

If an average village property costs approx £200,000 then a household is likely to require **£20,000** as a deposit, and their annual income for mortgage purposes would have to be at least **£51,428**
